In-phase and quadrature I/Q signal

Advanced modulation formats require that both the phase and amplitude of the demodulated signal is analyzed. The standard analysis method and also the less suitable method interprets a signal in polar coordinates, i.e. in both magnitude and angle. However, it is much easier to analyze a signal by decomposing it in its in-phase (sine) and quadra-

ture (cosine) components. Since these signals are orthogonal the decomposition effectively creates two independent signals occupying the same spectral space. The two signals may then be investigated in just magnitude or in both magnitude and angle.
